
Basis for determining the power station solar container storage capacity

Can fixed energy storage capacity be configured based on uncertainty of PV power generation?

As PV power outputs have strong random fluctuations and uncertainty, it is difficult to satisfy the grid-connection requirements using fixed energy storage capacity configuration methods. In this paper, a method of configuring energy storage capacity is proposed based on the uncertainty of PV power generation.

What is the optimal configuration of energy storage capacity?

The optimal configuration of energy storage capacity is an important issue for large scale solar systems. A strategy for optimal allocation of energy storage is proposed in this paper. First various scenarios and their value of energy storage in PV applications are discussed. Then a double-layer decision architecture is proposed in this article.

Do energy storage capacity configurations affect forecasting errors in different weather conditions?

This study focuses on the energy storage capacity configuration of PV plants considering the uncertainty of PV output and the distribution characteristics of the forecasting error in different weather conditions.

Compensating for PV power forecast errors is an important function of energy storage systems [16, 17].

How do energy storage systems compensate for PV power forecast errors?

Compensating for PV power forecast errors is an important function of energy storage systems [16, 17].

The capacity of an energy storage system is calculated based on the PV power forecast; an energy storage device is used to compensate for the power forecast error, effectively reducing the loss caused by the PV power forecast error.
