## Differences between sodium-sulfur batteries and flow batteries

Which battery energy storage system uses sodium sulfur vs flow batteries?

The analysis has shown that the largest battery energy storage systems use sodium-sulfur batteries, whereas the flow batteries and especially the vanadium redox flow batteries are used for smaller battery energy storage systems.

What is a sodium sulfur battery?

A sodium-sulfur battery is a type of molten metal battery constructed from sodium and sulfur, as illustrated in Fig. 5. This type of battery has a high energy density, high efficiency of charge/discharge (75-86%), long cycle life, and is fabricated from inexpensive materials.

What is a flow battery?

Flow batteries A flow battery is a form of rechargeable battery in which electrolyte containing one or more dissolved electro-active species flows through an electrochemical cell that converts chemical energy directly to electricity.

What is the difference between a redox flow battery and a fuel cell?

The main difference between these two types of flow batteries is that the energy of the redox flow battery, as with other fuel cells, is fully decoupled from the power, because the energy is related to the electrolyte volume, i.e., to the tank size, and the power to the electrode area, i.e., to the reactor size.
