How to ground a solar inverter?

Solar inverters can be grounded by using a grounding rod made of copper. Grounding and earthing are crucial for safe and effective inverter installation. They ensure the metal components are at the same electrical potential as the Earth's surface. In this blog, we will learn how to ground solar inverters and off-grid earthing techniques.

Which grounding rods are used in a solar inverter?

As shown in the fig, separate grounding rods are used for individual systems e.g. AC side and DC side. The equipment grounding conductor (EGC) from the main panel and PV arrays are connected to the Ground terminal and Ground bus in the inverter.

Can a grounded inverter be isolated from a grounding circuit?

Modern grounded inverters and PV arrays are not isolated from the grounded output circuit of the inverter. In this scenario, the equipment grounding conductor (EGC) of the PV circuit can be connected to the grounding terminal of the inverter, which is eventually connected to the AC grounding system and electrode within the premises.

What is a grounding conductor (EGC) in a solar inverter?

The equipment grounding conductor (EGC) from the main panel and PV arrays are connected to the Ground terminal and Ground bus in the inverter. Both grounding electrode conductors (GEC) are connected to the individual grounding rod used for both systems.
