## How complex is the energy management system for solar container communication stations

Are communication and control systems needed for distributed solar PV systems?

The existing communication technologies, protocols and current practice for solar PV integration are also introduced in the report. The survey results show that deployment of communication and control systems for distributed PV systems is increasing.

How many parts of an IEMs framework support solar energy integration?

In reviewing the existing literature on IEMS, it was determined that there are five major parts of an IEMS framework that supports solar energy integration: the power system the IEMS operates in, solar energy forecasting (SEF), demand side management (DSM), and supply side management (SSM).

How do energy management systems support grid integration?

While energy management systems support grid integration by balancing power supply with demand, they are usually either predictive or real-time and therefore unable to utilise the full array of supply and demand responses, limiting grid integration of renewable energy sources. This limitation is overcome by an integrated energy management system.

Do distributed PV systems need a grid-scale coordinated control network?

The increasing penetration of distributed PV systems also request for a grid-scale coordinated control network. The control paradigm of current electrical power system is slow, open-looped, centralized, human-in-the-loop, deterministic and, in worst-case, preventive.
