
Mobile base station power transformer model

Can a transformer model predict 5G base station traffic?

One such task is the prediction of 5G base station traffic, where each time window corresponds to a segment of actual traffic load on the base station. Therefore, the Transformer model can be used to model and predict the traffic load of 5G base stations, providing a reference and basis for related business decisions.

What is a spatiotemporal transformer framework for multi-task mobile network prediction?

Our proposed spatiotemporal transformer framework for the multi-task mobile network prediction. Our proposed model contains three key parts. First, to capture the complex interaction between mobile traffic and connected users, we propose the temporal cross-attention encoder. Then, to identify

What is a transformer model?

The Transformer model is a neural network model that is used for sequential modeling. Due to its internal self-attention mechanism and Positional Encoding method, the model has achieved excellent results in natural language processing tasks such as text summarization and language translation.

What is a spatiotemporal transformer framework (STMP)?

STMP prediction considers interdependence, reduces complexity and provides a more comprehensive understanding of the mobile network. We propose a spatiotemporal transformer framework (STMP) for the multi-task mobile network prediction in large-scale networks. Our framework includes cross-attention and hierarchical spatial attention
