
Solar field to inverter

How do you connect solar panels to a solar inverter?

First, connect individual solar panels into "strings" by linking the positive lead of one panel to the negative lead of the next using their MC4 connectors. This series connection adds the voltage of each panel together, creating a higher string voltage that is more efficient for the inverter.

What is a solar inverter?

Solar inverters are the heart of any solar power system, converting the direct current (DC) electricity generated by solar panels into alternating current (AC) electricity, which is used by most household appliances and connected to the power grid.

How do solar inverters work?

In a large-scale utility plant or mid-scale community solar project, every solar panel might be attached to a single central inverter. String inverters connect a set of panels--a string--to one inverter. That inverter converts the power produced by the entire string to AC.

Should solar panels be wired to an inverter?

Solar panels should always be wired to an inverter through a charge controller first rather than connected directly. This helps ensure the DC current is consistent, preventing dangerous spikes or fluctuations that can damage it. From preparation to photovoltaic installation, connecting an inverter to your system is not something you just do.
