## Solar inverter layout on islands

How does a sunny island inverter work?

The Sunny Island disconnects the battery-backup grid from the utility grid and supplies the battery-backup grid. Open, the battery-backup grid is not connected to the utility grid. The inverter can be used in off-grid, backup or self-consumption systems.

How many sunny island inverters are connected to one battery?

In a single-phase single-cluster system, up to 3 Sunny Island inverters are connected to one battery forming a cluster. The Sunny Island inverters are connected on the AC side to the same line conductor. Multicluster systems consist of several three-phase clusters. The individual clusters must be connected to a Multicluster-Box.

What is the nominal power of a sunny island inverter?

The nominal power of the Sunny Island inverter is 4600 W. This means that the nominal power of the generator should be between 3680 W (80%) and 5520 W (120%). In order that the generator is ideally utilized, a nominal power of less than 4600 W (100%) is recommended (see Section 3.6, page 18).

Can sunny island inverters be used in single-phase single-cluster systems?

In a single system, one Sunny Island forms a single-phase stand-alone grid. In single-phase single-cluster systems, the Sunny Island inverters must be of the same device type (see Section 6.6, page 50). SI 4.4M devices cannot be used in single-phase single-cluster systems.
